institute

HDS Tutorial 4

Week 8

| Brittany Blankinship | 30 May & 2 June 2022 |

Audio check

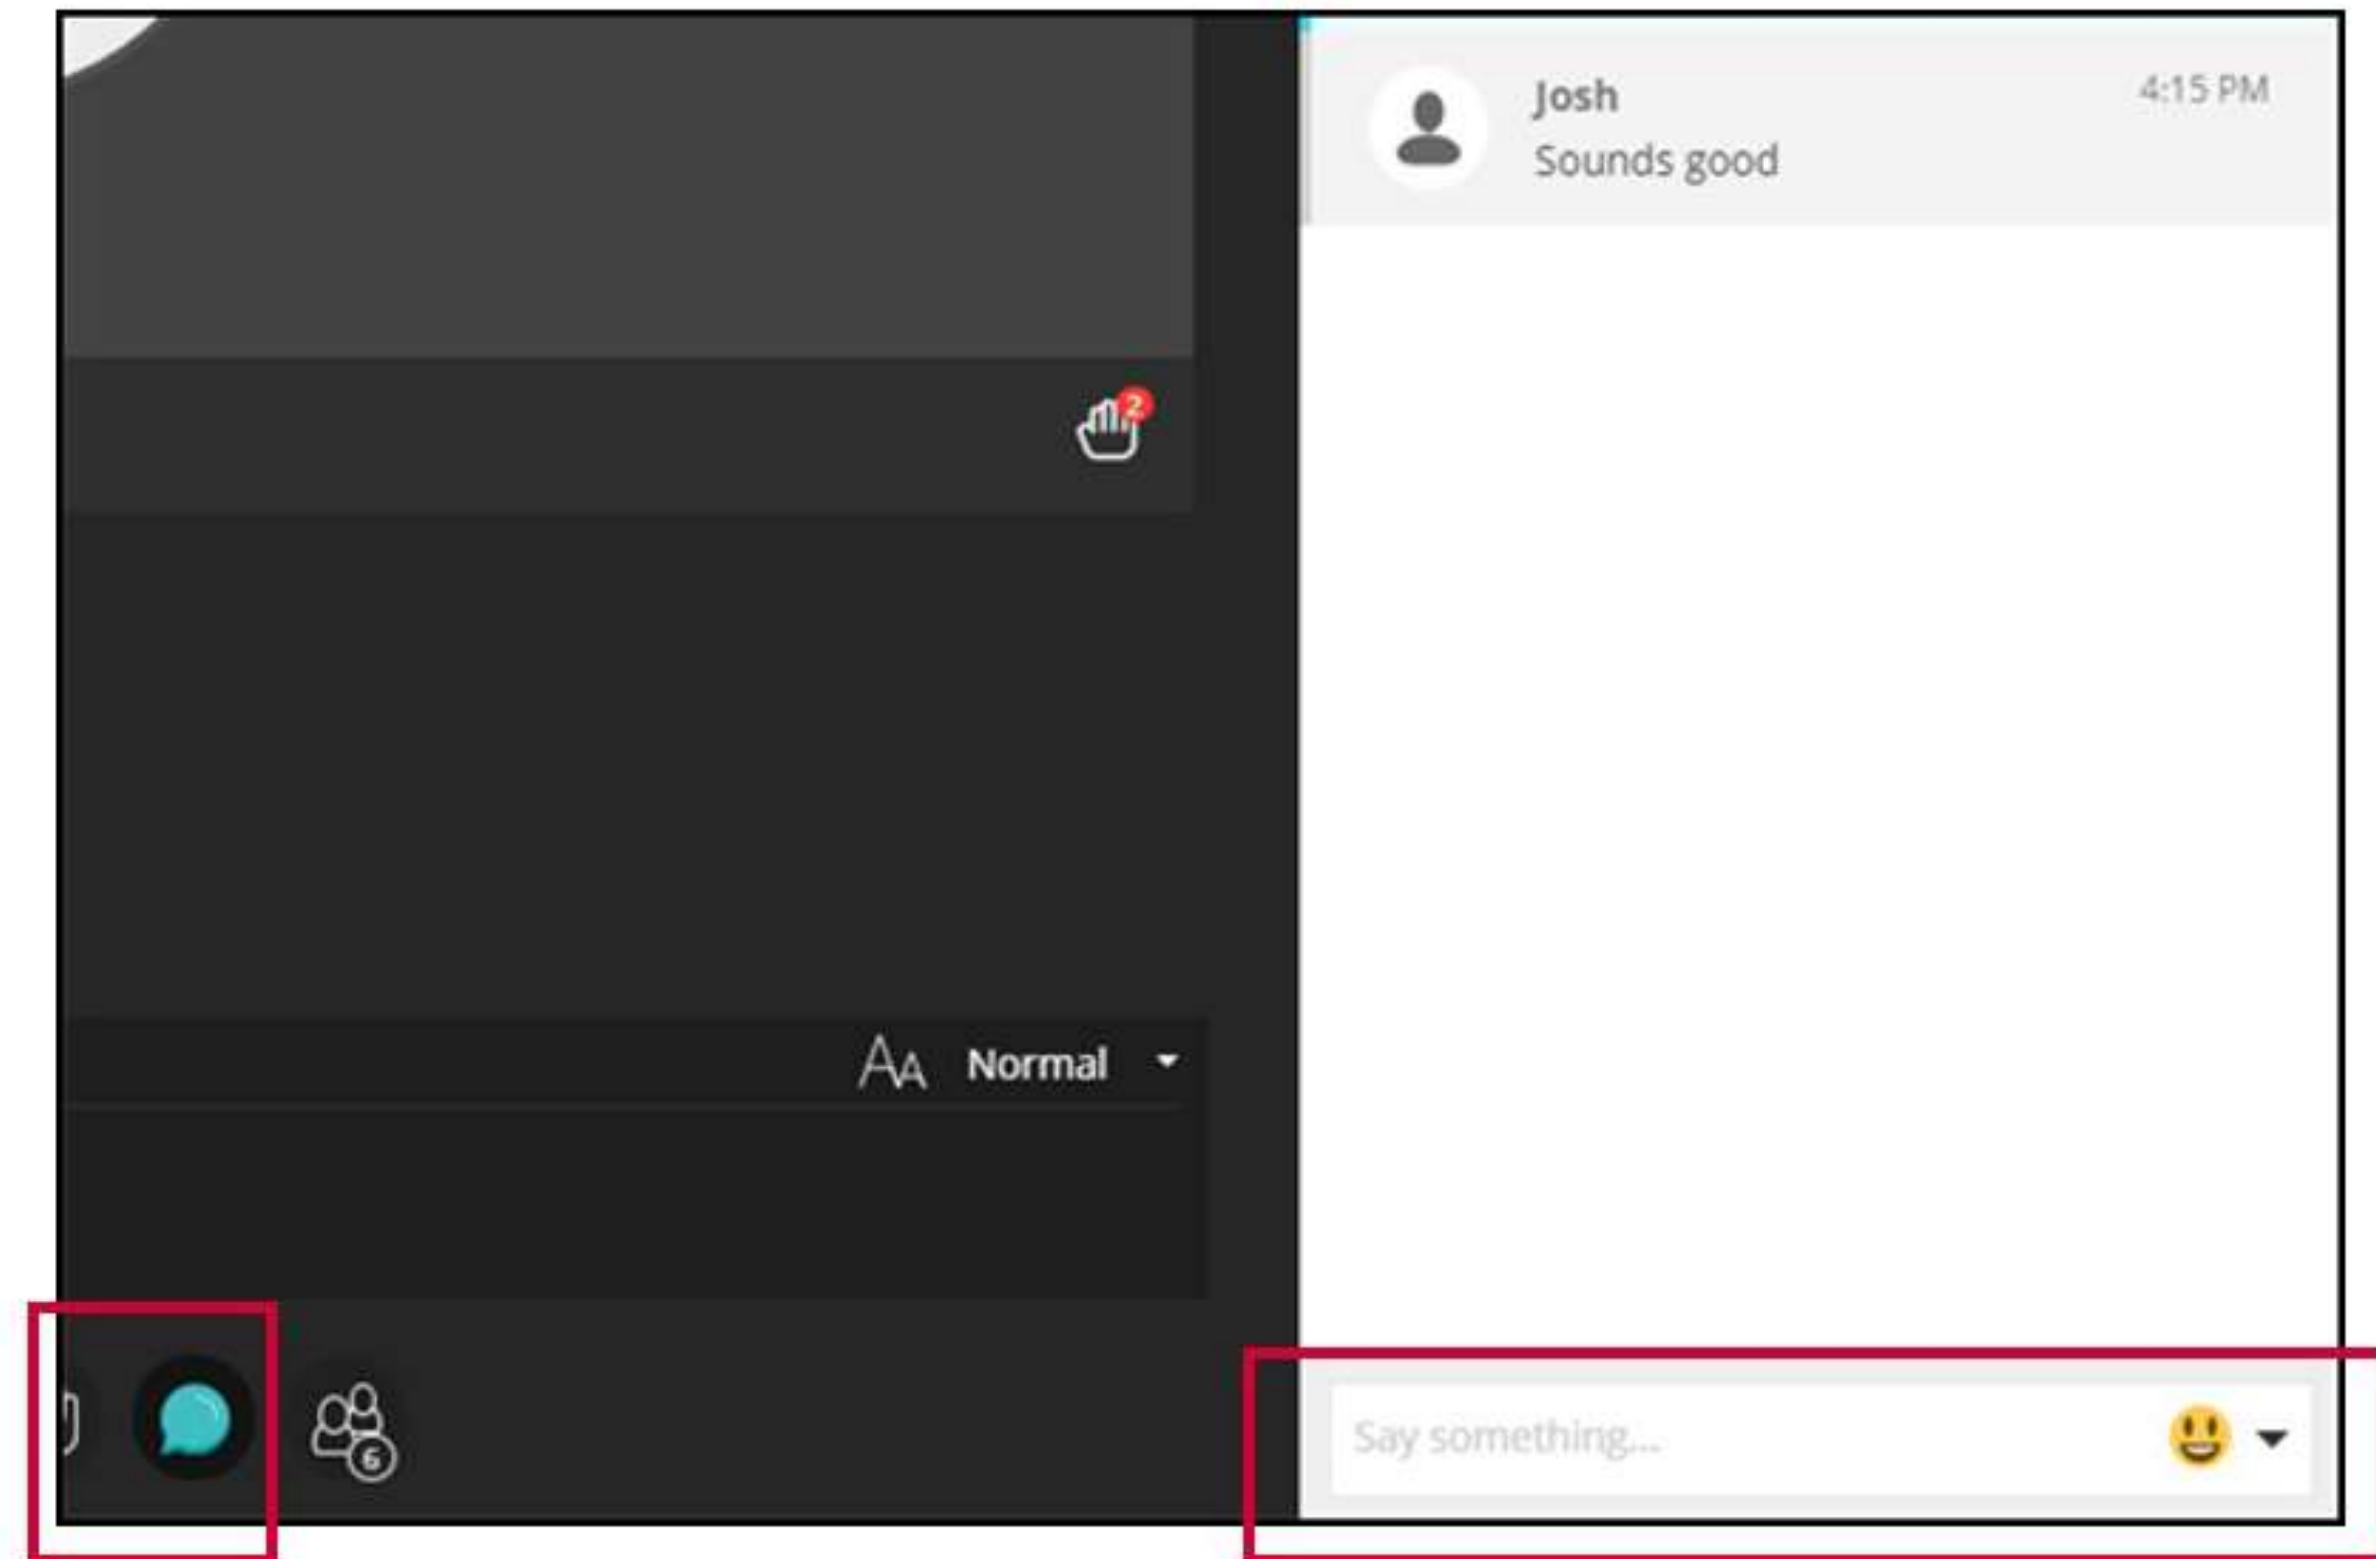

Open to
the world

Can you hear the presenter talking?

Please type **yes** or **no** in the “Text chat area”

If you can't hear:

- Check your Audio/Visual settings in the Collaborate Panel
- Try signing out and signing back into the session
- Type into the chat box and a moderator will try to assist you

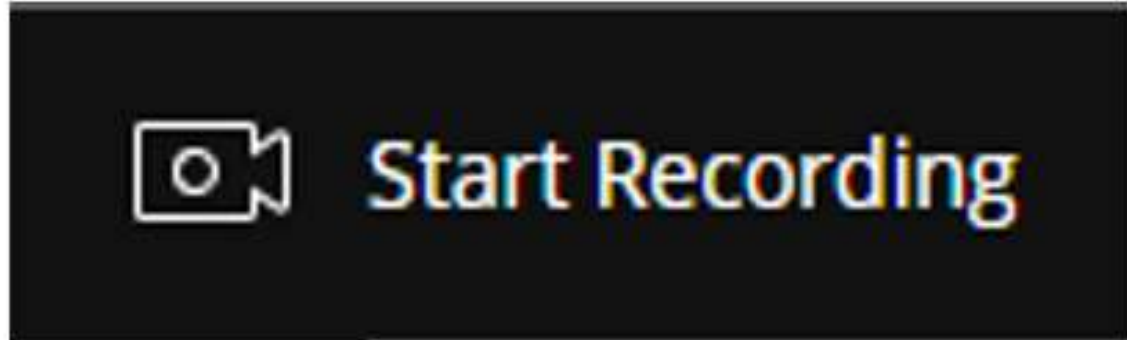

Recording

Open to
the world

This session will now be recorded. Any further information that you provide during a session is optional and in doing so you give us consent to process this information.

These sessions will be stored by the University of Edinburgh for one year and published for 30 days after the event. Schools or Services may use the recordings for up to a year on relevant websites.

By taking part in a session, you give us your consent to process any information you provide during it.

HDS Tutorial 4

Week 8

| Brittany Blankinship | 30 May & 2 June 2022 |

Agenda

- **Interactive overview of key functions discussed in the course**
- **R Markdown knit to PDF demo**
- **Q&A**

Have you managed to successfully
knit an R Markdown document?

Summary of key functions

Brittany's computer

R hex stickers are so fun!

Importing Data

★ `read_csv()`

```
#from a webpage
activity_raw <- read_csv("https://www.opendata.nhs.scot/dataset/0e17f3fc-9429-48aa-b1ba-2b7e55688253
/resource/748e2065-b447-4b75-99bd-f17f26f3eaef/download/hd_activitybyhbr.csv")

#from a saved file on your computer in a folder called data
mortality_raw <- read_csv(here::here("./data/heartdiseaseMortalitybyHB.csv"))

#or without the here package
mortality_raw <- read_csv("./data/heartdiseaseMortalitybyHB.csv")
```

Variable naming conventions

★ `clean_names()`

Defaults to snake case, but there are 18 options you can choose from

Logical Operators

< Less than

> Greater than

== Equal to

<= Less than equal to

>= Greater than equal to

!= Not equal to

%in% Group membership

Figure 5.1: Complete set of boolean operations. x is the left-hand circle, y is the right-hand circle, and the shaded region show which parts each operator selects.

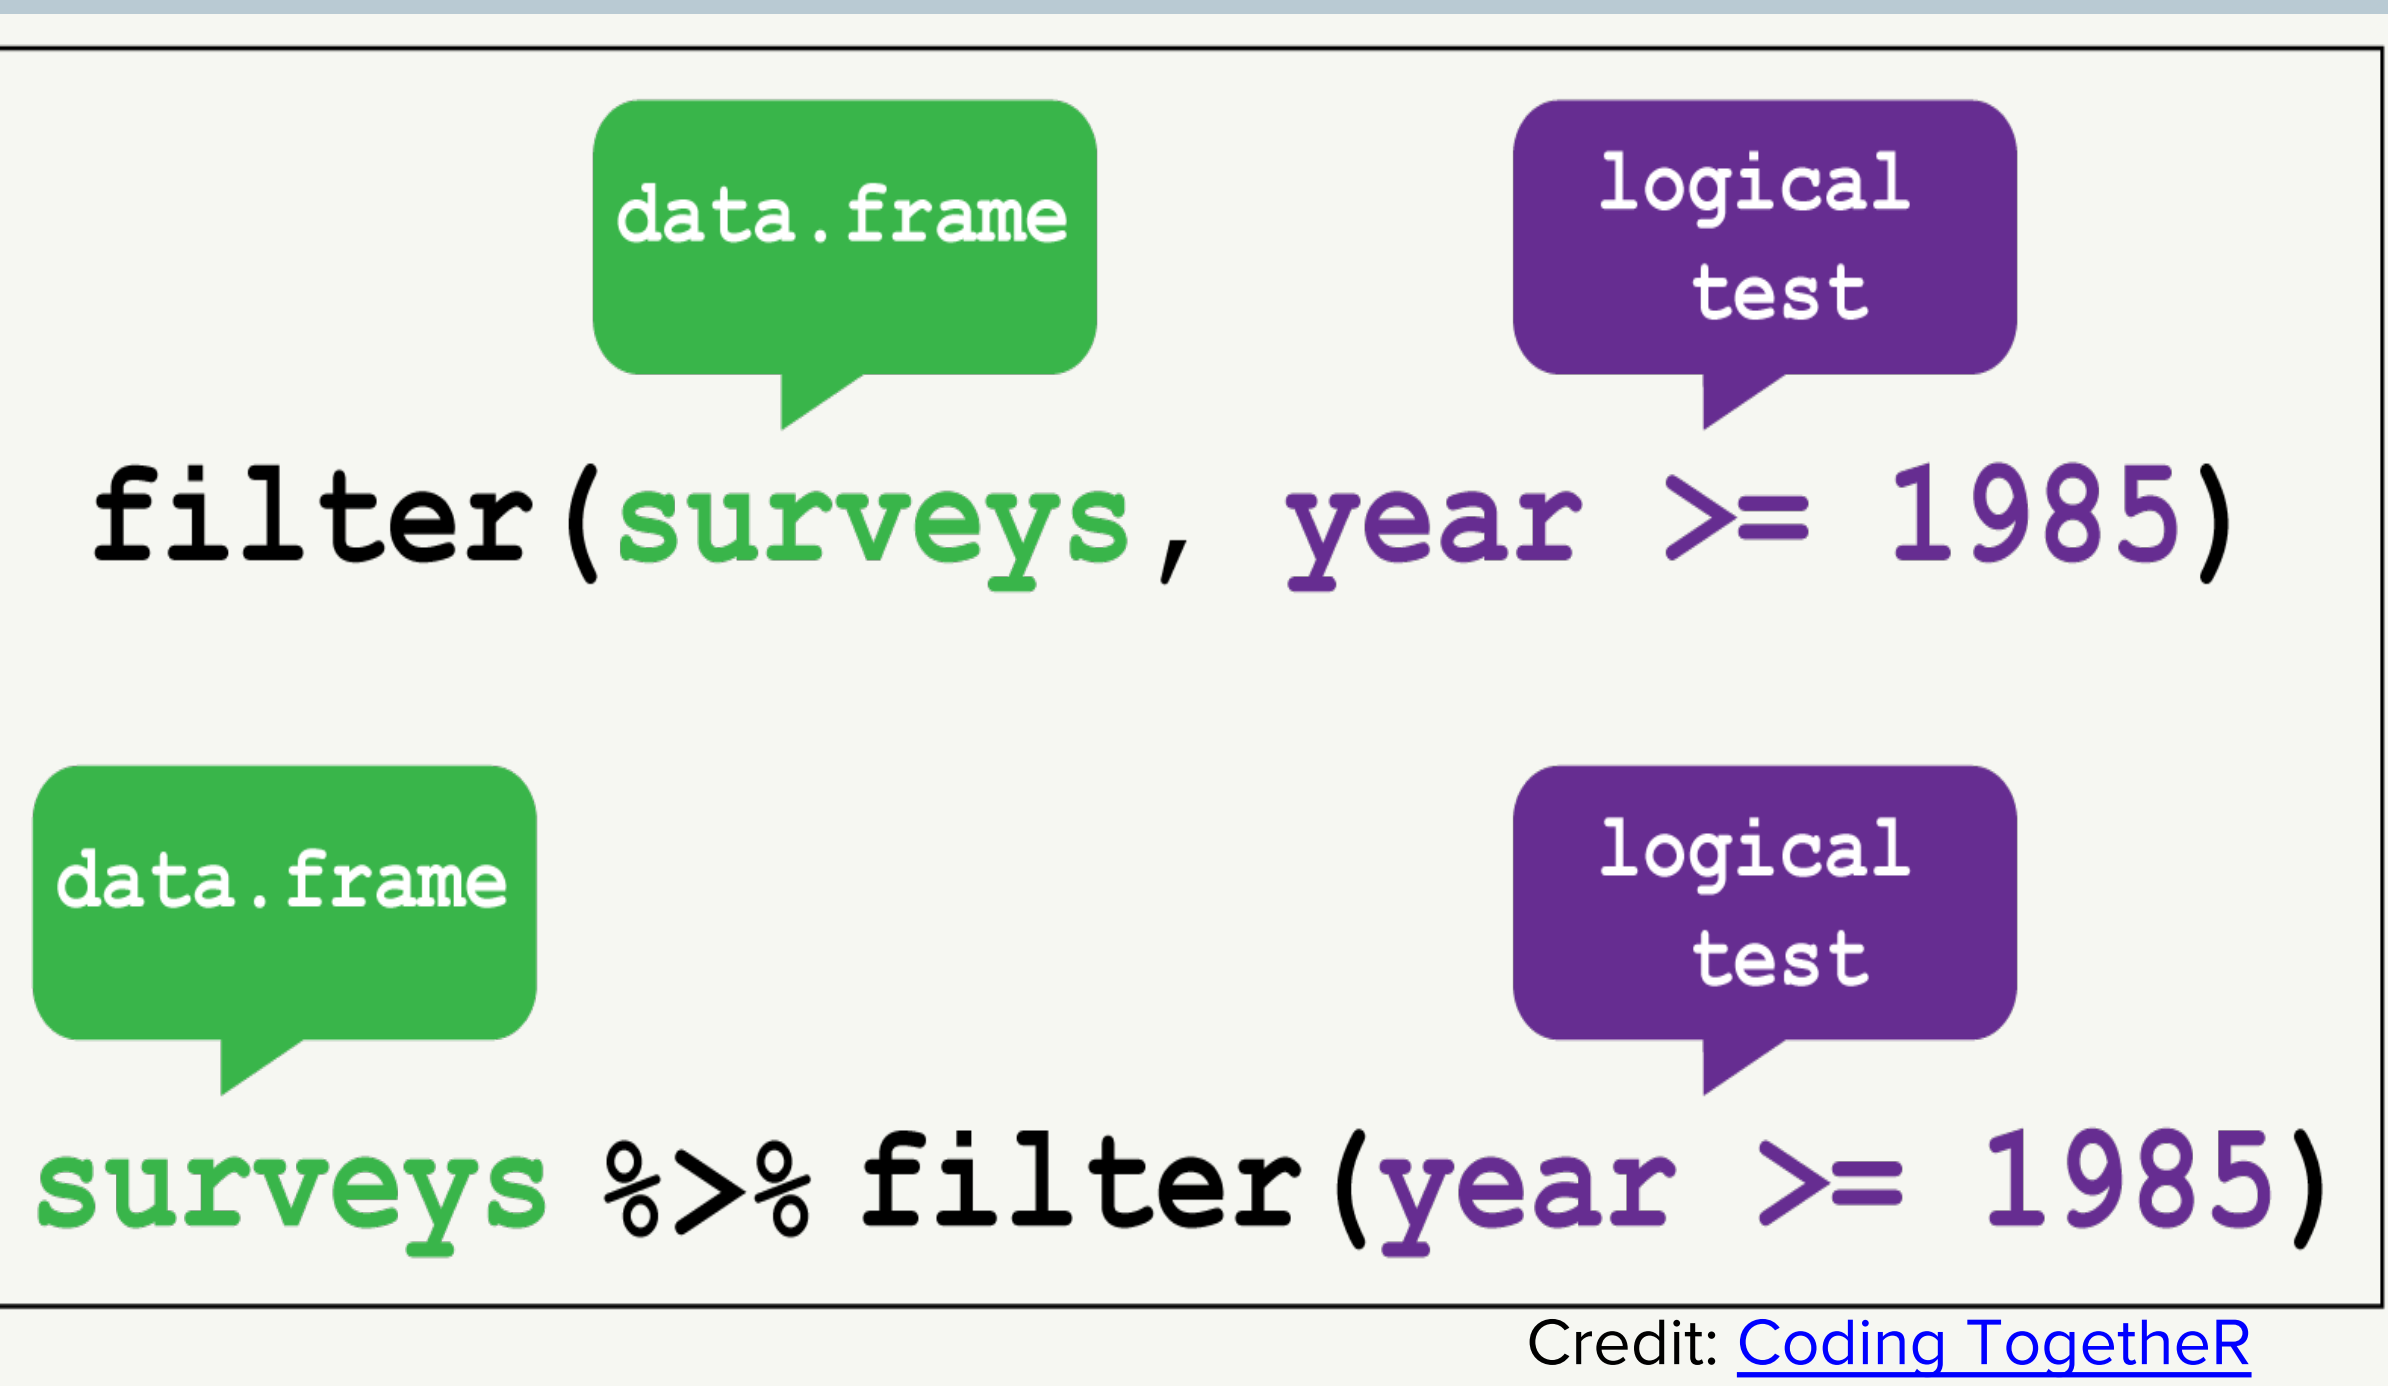

Source: R for Data Science book, Figure 5.1

Subsetting Data (observations)

★ `filter()`

Extract rows of existing data
that meeting logical
conditions

For more check out this RStudio Data Manipulation video from Garrett Grolemund https://www.youtube.com/watch?v=Zc_ufg4uW4U

★ `select()`

Select columns by name or helper functions

Helper functions for `select` - `?select`

`select(iris, contains("."))`

Select columns whose name contains a character string.

`select(iris, ends_with("Length"))`

Select columns whose name ends with a character string.

`select(iris, everything())`

Select every column.

`select(iris, matches("t."))`

Select columns whose name matches a regular expression.

`select(iris, num_range("x", 1:5))`

Select columns named x1, x2, x3, x4, x5.

`select(iris, one_of(c("Species", "Genus")))`

Select columns whose names are in a group of names.

`select(iris, starts_with("Sepal"))`

Select columns whose name starts with a character string.

`select(iris, Sepal.Length:Petal.Width)`

Select all columns between Sepal.Length and Petal.Width (inclusive).

`select(iris, -Species)`

Select all columns except Species.

Subsetting Data (variables)

data.frame

column
variables

```
select(surveys, year, plot_type)
```

data.frame

column
variables

```
surveys %>% select(year, plot_type)
```

Credit: [Coding TogetherR](#)

New Variables

★ `mutate()`

Compute and append one or more new columns – changes an existing column or adds a new one

Works with grouped data or the whole dataset

Original columns remain after being passed to mutate

data.frame

new column
variable

expression

```
mutate(surveys, weight_kg = weight/1000)
```

data.frame

new column
variable

expression

```
surveys %>% mutate(weight_kg = weight/1000)
```

Credit: [Coding TogetherR](https://www.youtube.com/watch?v=Zc_ufg4uW4U)

For more check out this RStudio Data Manipulation video from Garrett Grolemund https://www.youtube.com/watch?v=Zc_ufg4uW4U

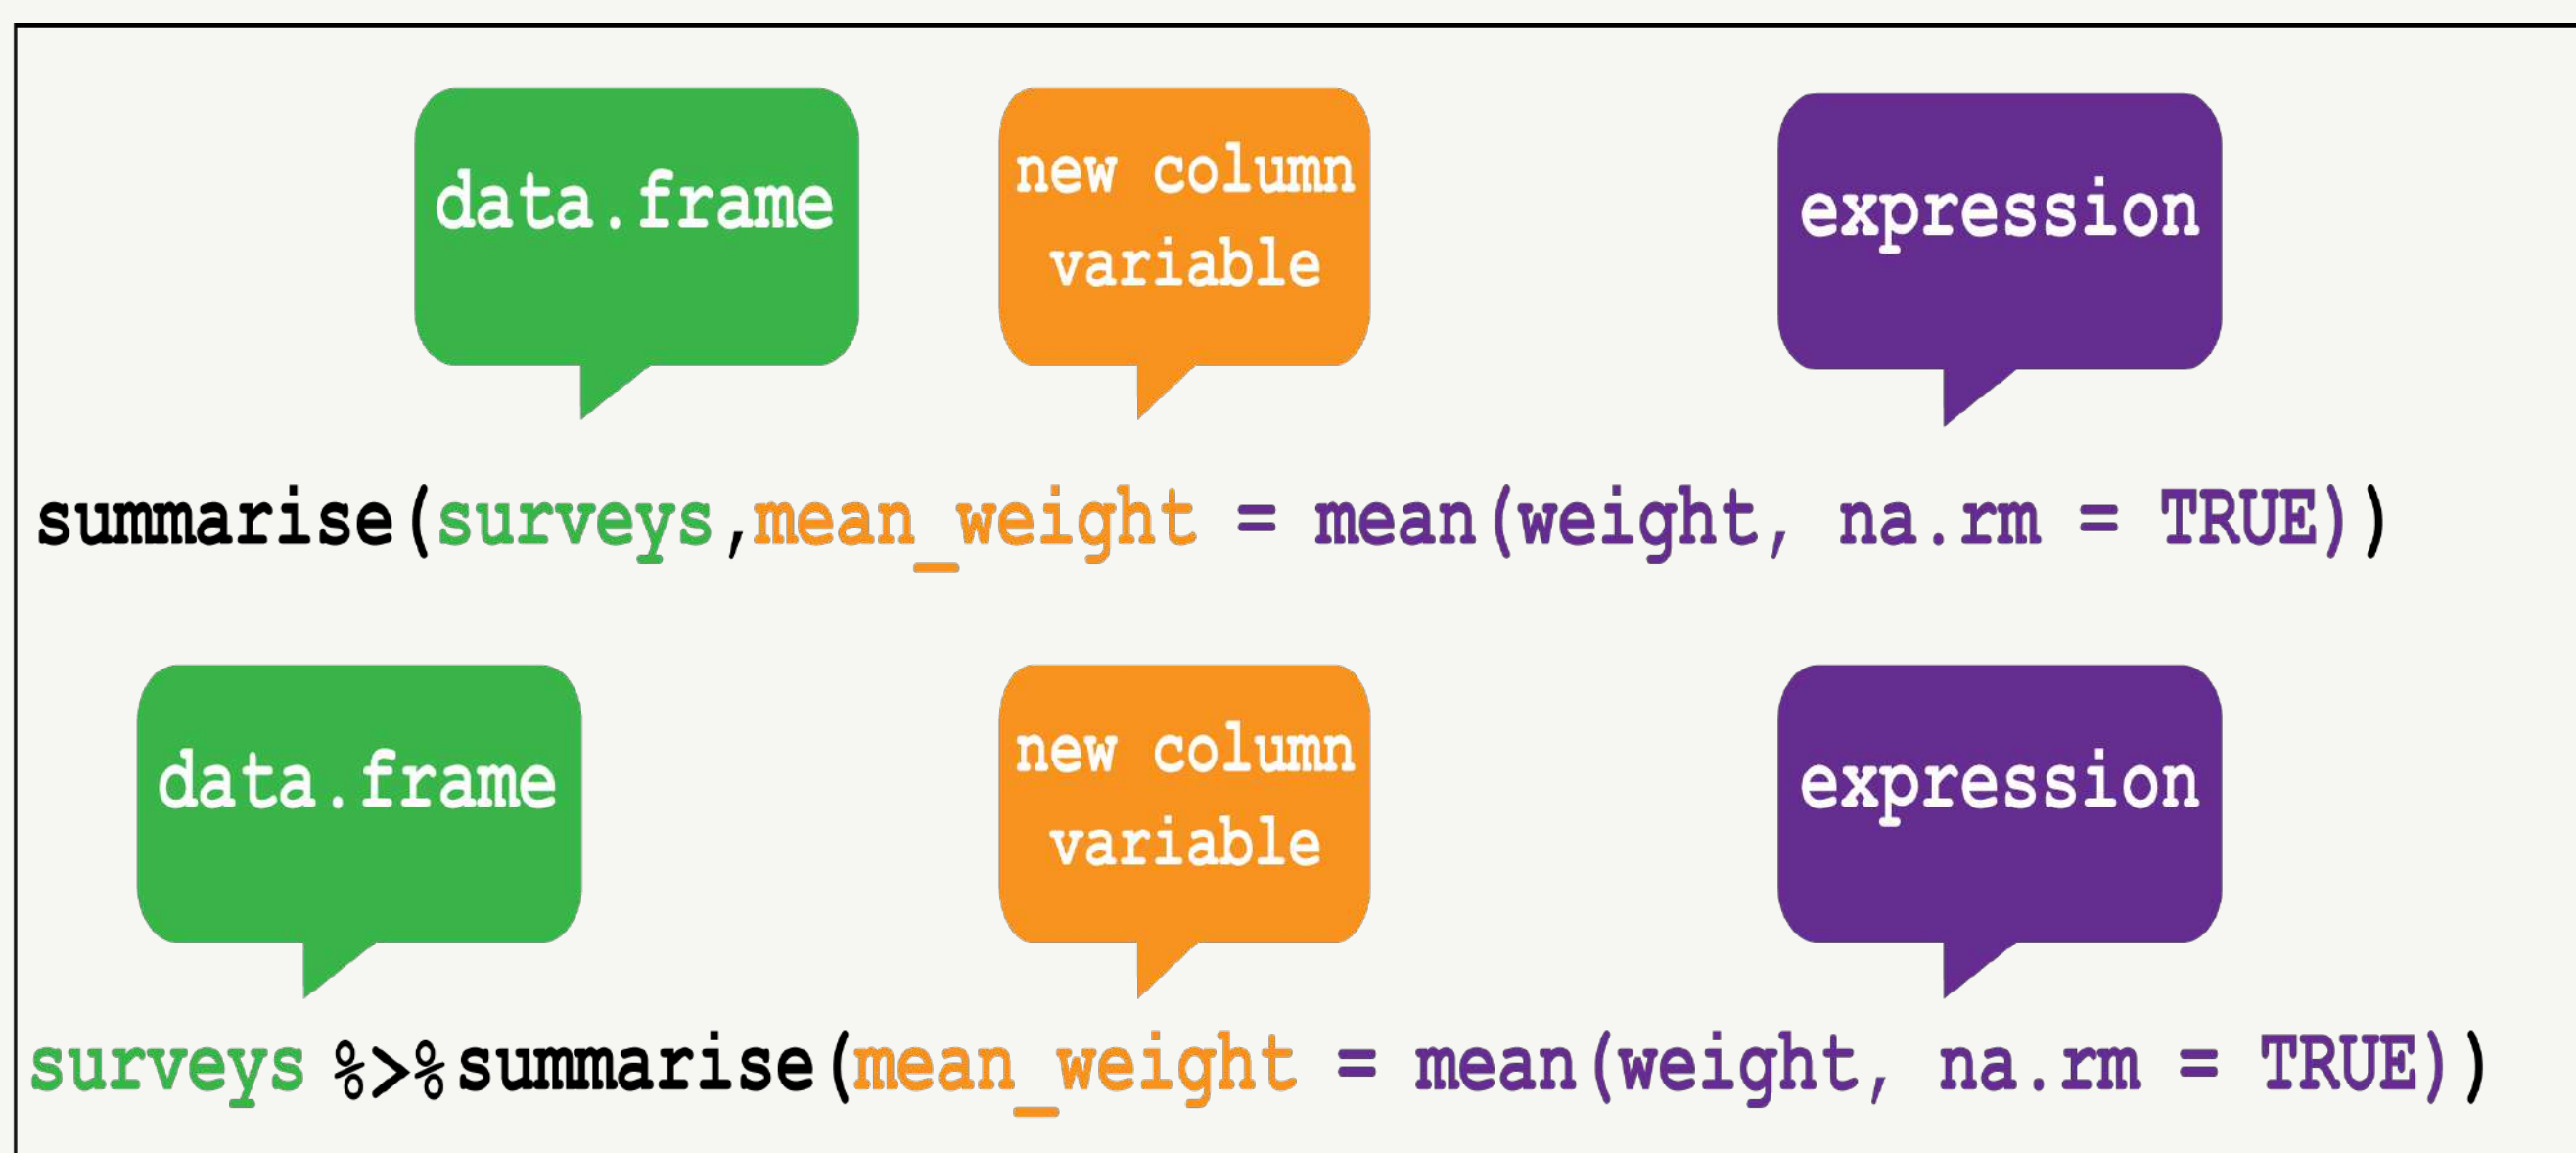

Summarise

★ `summarise()`

Summarise data into single row of values

Drops variables not listed in `group_by()` or created inside it, drops columns after calculating the new one

Credit: [Coding TogetherR](#)

For more check out this RStudio Data Manipulation video from Garrett Grolemund https://www.youtube.com/watch?v=Zc_ufg4uW4U

Group Data

★ `group_by()`

Group data into rows according to column variables

★ `ungroup()`

Remove grouping information from the data frame – particularly useful when wrangling data for tables

```
data.frame column
variables
group_by(surveys, species_id, rodent_type) %>%
  summarise(mean_weight = mean(weight, na.rm = TRUE))

data.frame column
variables
surveys %>% group_by(species_id, rodent_type) %>%
  summarise(mean_weight = mean(weight, na.rm = TRUE))
```

Credit: [Coding TogetherR](#)

For more check out this RStudio Data Manipulation video from Garrett Grolmund https://www.youtube.com/watch?v=Zc_ufg4uW4U

Data formats & Tidy Data

“**TIDY DATA** is a standard way of mapping the meaning of a dataset to its structure.”

—HADLEY WICKHAM

In tidy data:

- each variable forms a column
- each observation forms a row
- each cell is a single measurement

each column a variable

id	name	color
1	floof	gray
2	max	black
3	cat	orange
4	donut	gray
5	merlin	black
6	panda	calico

each row an observation

Wickham, H. (2014). Tidy Data. *Journal of Statistical Software* 59 (10). DOI: 10.18637/jss.v059.i10

Ways data can become untidy:

- Column headers contain values, rather than names
- Multiple variables are stored in a single column
- Variables are stored in both rows and columns
- Multiple observational types are stored in a single table
- A single observational unit is stored in multiple tables

Wickham, H. (2014). Tidy data. *Journal of statistical software*, 59(1), 1-23.

For more on tidy data see the above paper & Chapter 12 of the R for Data Science Book

Data formats & Tidy Data

wide

id	x	y	z
1	a	c	e
2	b	d	f

long

id	key	val
1	x	a
2	x	b
1	y	c
2	y	d
1	z	e
2	z	f

“Long” format

country	year	metric
x	1960	10
x	1970	13
x	2010	15
y	1960	20
y	1970	23
y	2010	25
z	1960	30
z	1970	33
z	2010	35

“Wide” format

country	yr1960	yr1970	yr2010
x	10	13	15
y	20	23	25
z	30	33	35

Wide format = generally untidy, but found in many datasets

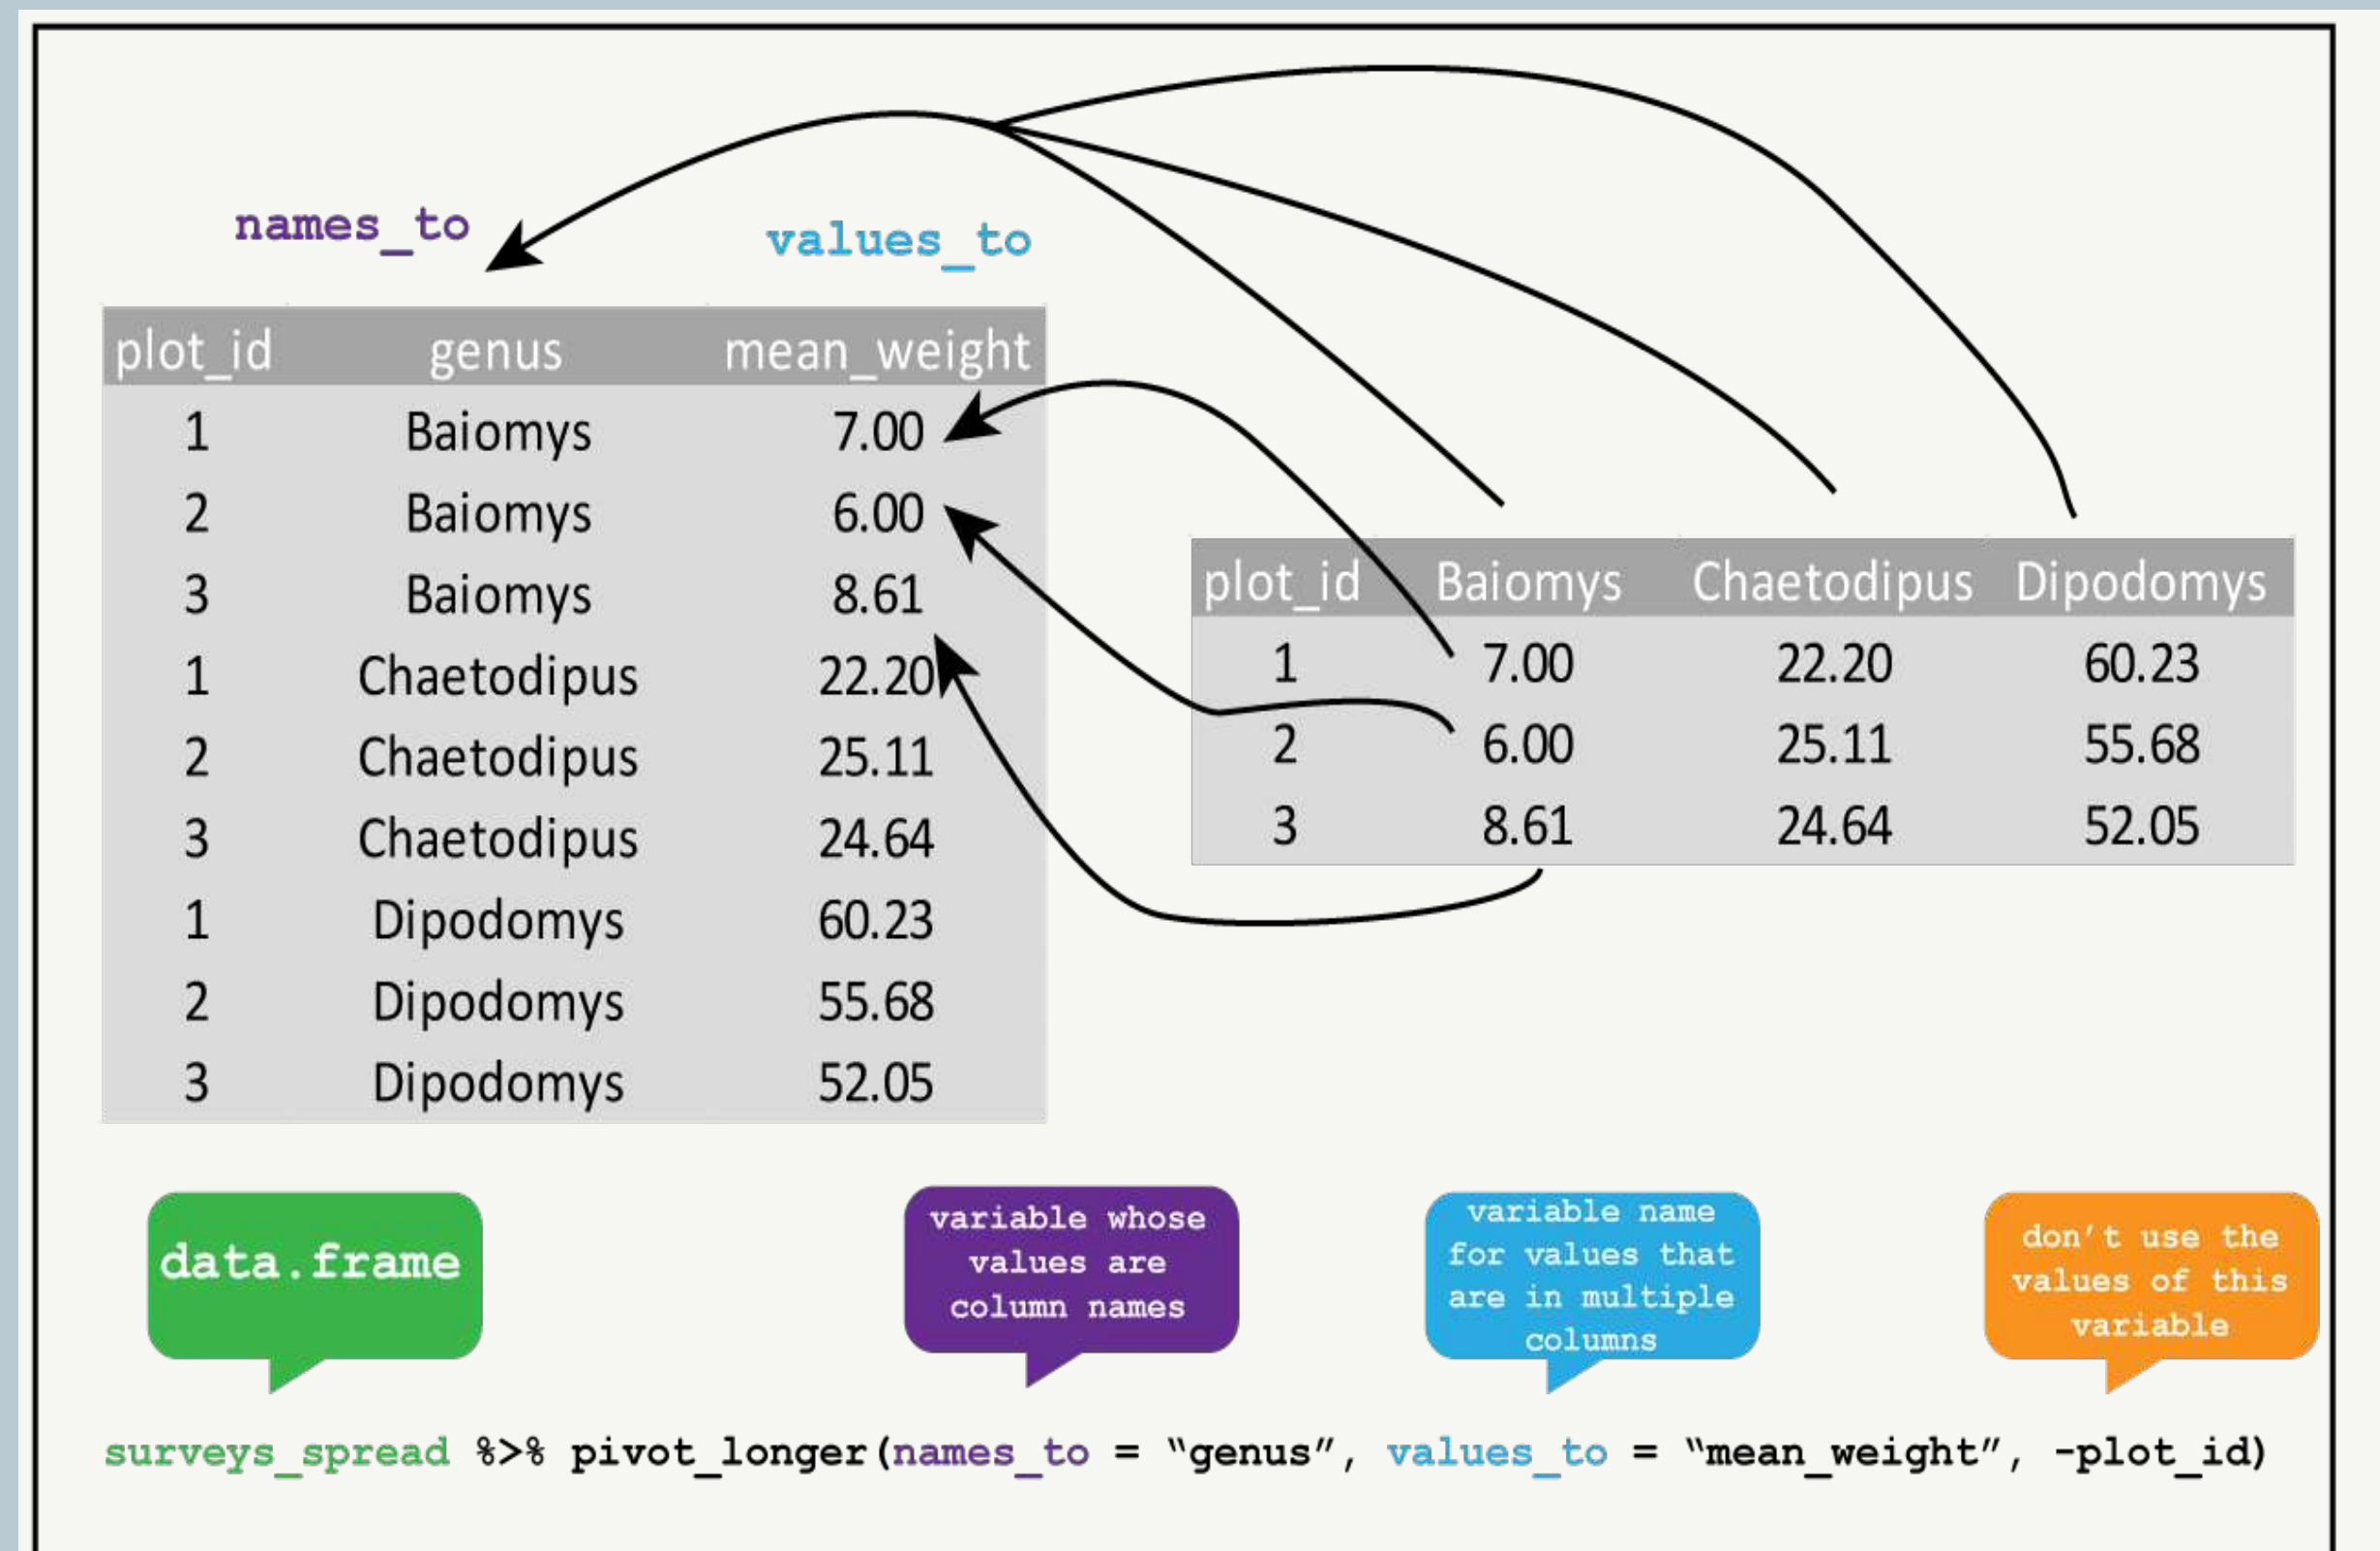

Transforming Data (wide to long)

★ `pivot_longer()`

Requires:

1. `data` = data you want to pivot
2. `names_to` = name of the column you want to create to capture condition, requires a character string
3. `values_to` = name of column you want to contain data values, requires a character string
4. `column X:column Y` = range of columns that you have and want to pivot longer, or that you do not want to pivot

Credit: Alistair Bailey's [Coding TogetherR](#)

Transforming Data

★ `pivot_longer()` = wide to long

country	1999	2000	2001	2002
Angola	800	750	925	1020
India	20100	25650	26800	27255
Mongolia	450	512	510	586

Pivot data longer

```
data %>%  
  pivot_longer(  
    cols = 1999:2002,  
    names_to = "year",  
    values_to = "cases"  
  )
```

country	year	cases
Angola	1999	800
Angola	2000	750
Angola	2001	925
Angola	2002	1020
India	1999	20100
India	2000	25650
India	2001	26800
India	2002	27255
Mongolia	1999	450
Mongolia	2000	512
Mongolia	2001	510
Mongolia	2002	586

Credit: [Epidemiologist R Handbook](#)

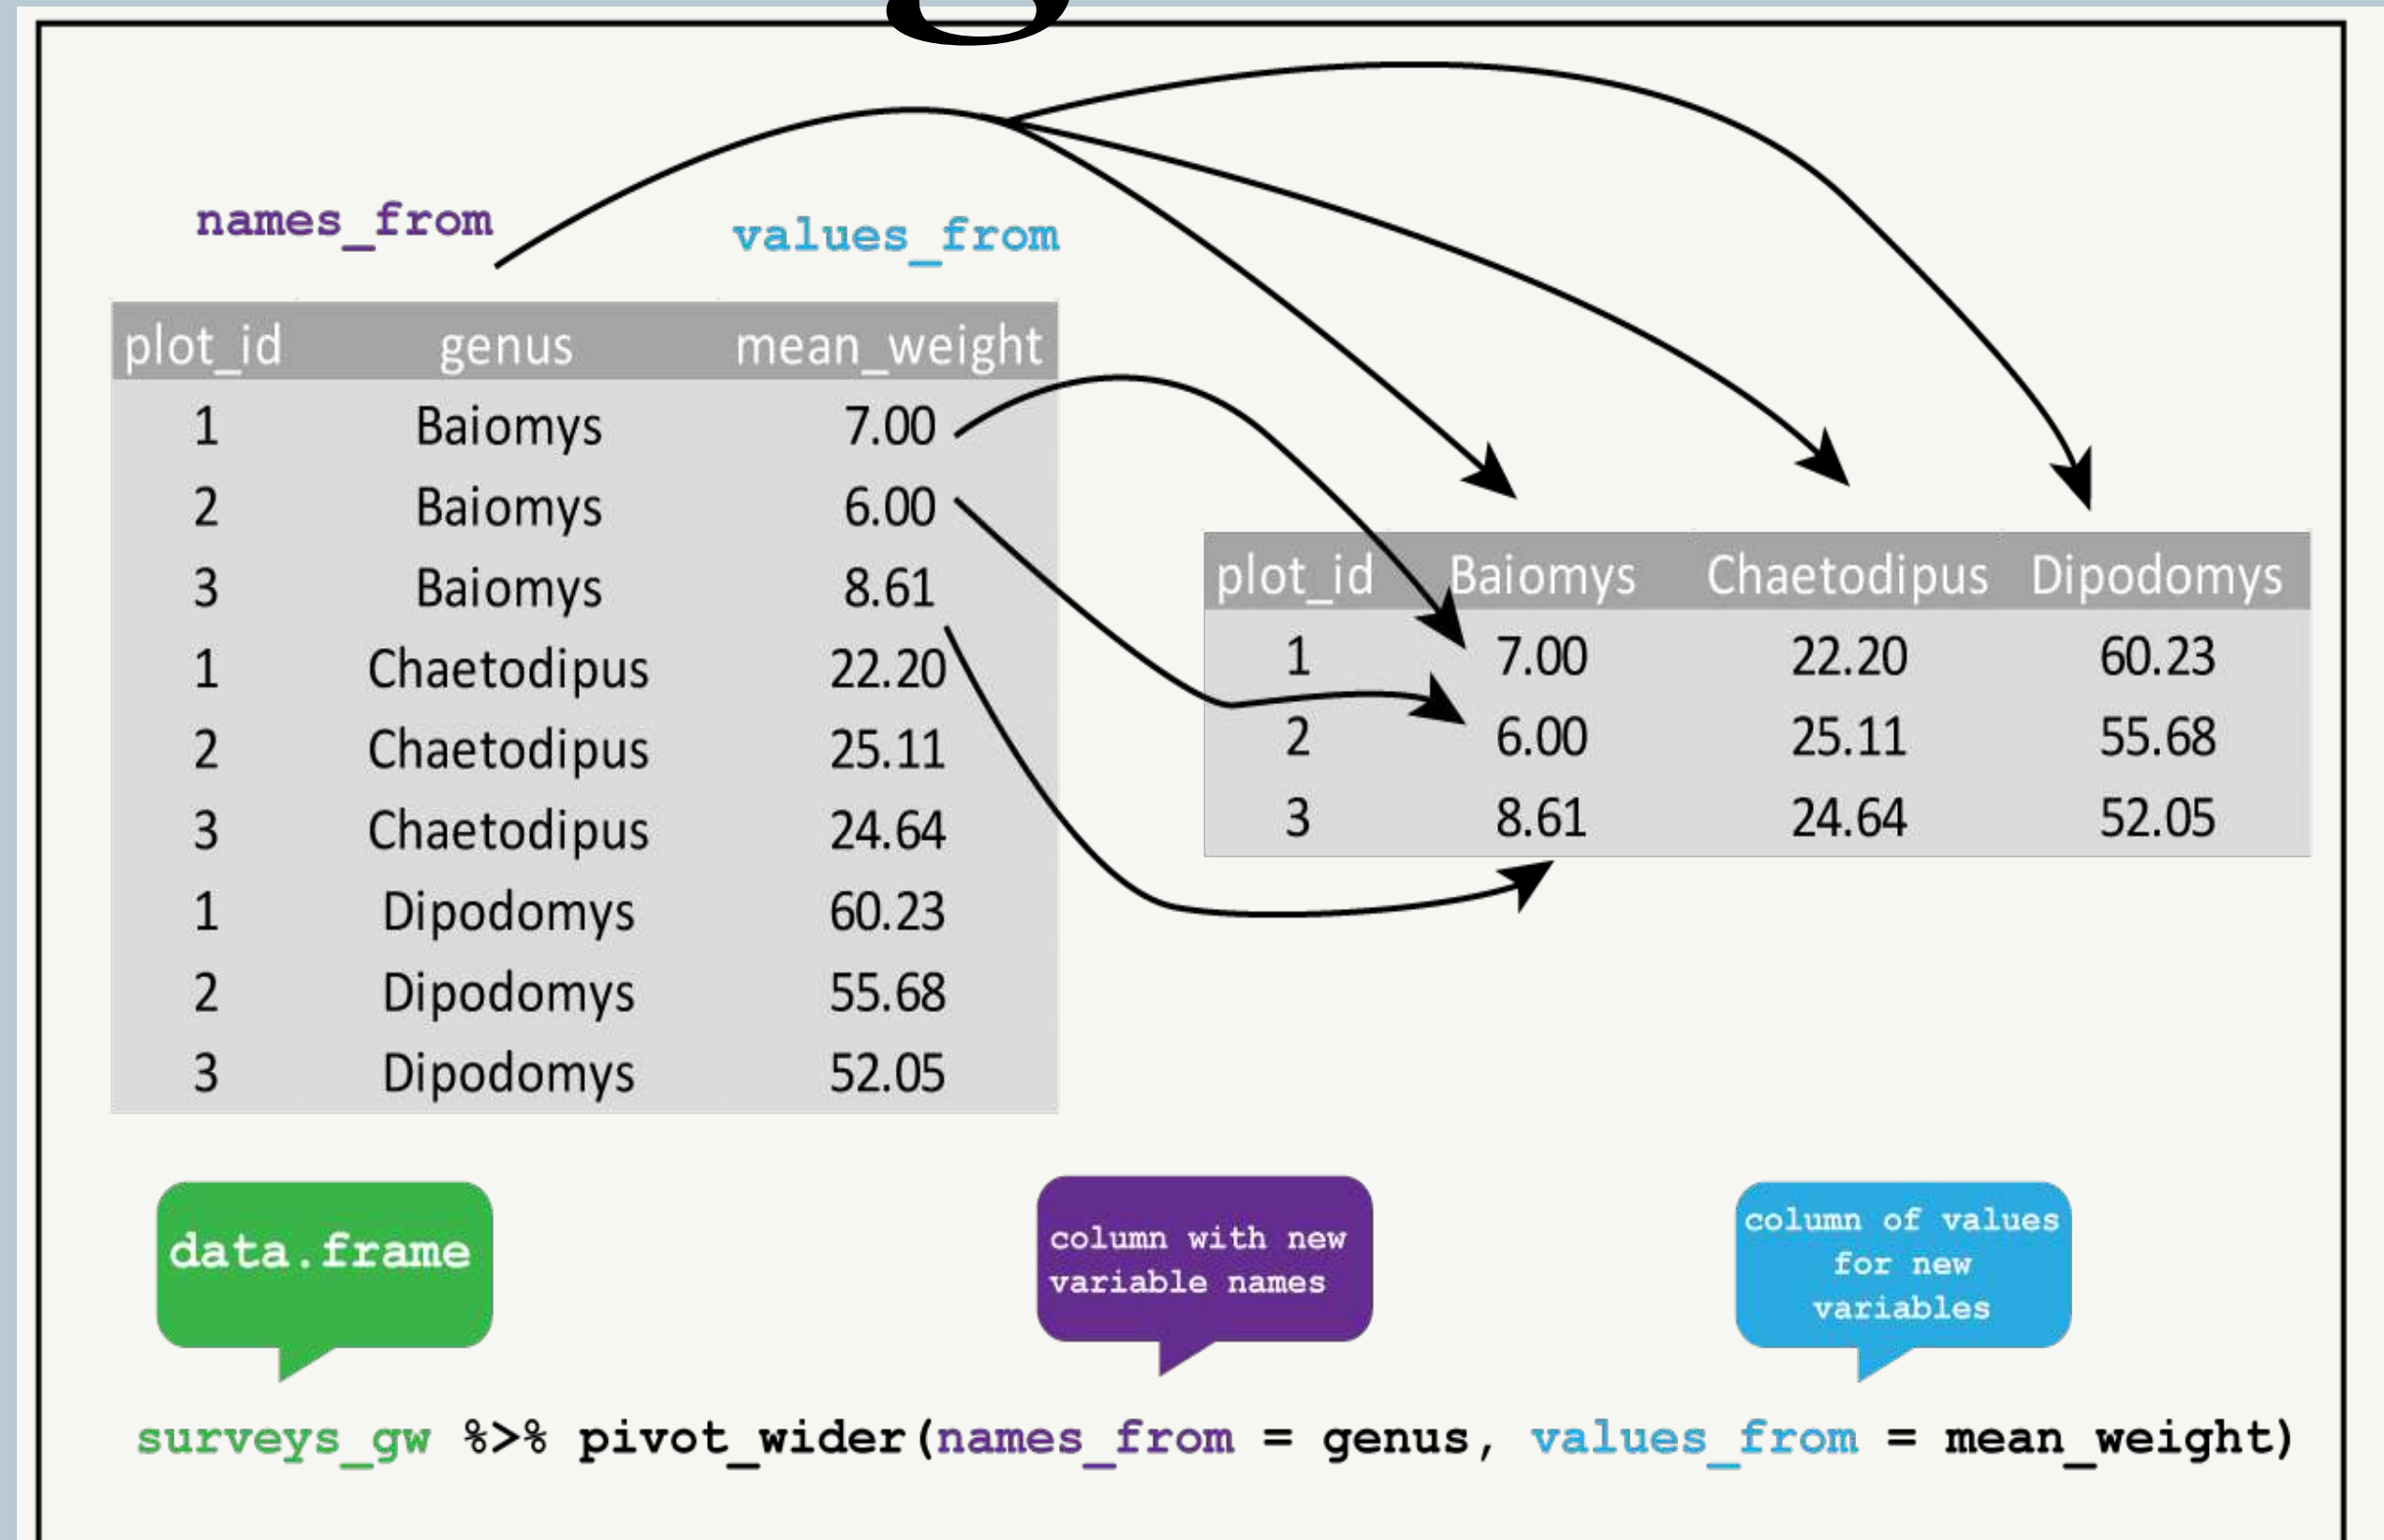

Transforming Data

(long to wide)

★ `pivot_wider()`

Requires:

1. `data` = data you want to pivot
2. `names_from` = name of column you want to end up in several columns
3. `values_from` = name of column that currently contains data values

Credit: Alistair Bailey's [Coding TogetherR](#)

For more check out this RStudio Data Wrangling video from Garrett Grolemund

<https://www.youtube.com/watch?v=1ELALQIO-yM> - however includes the now superseded functions `gather()` & `spread()`

Transforming Data

★ `pivot_wider()` = long to wide

country	year	cases
Angola	1999	800
Angola	2000	750
Angola	2001	925
Angola	2002	1020
India	1999	20100
India	2000	25650
India	2001	26800
India	2002	27255
Mongolia	1999	450
Mongolia	2000	512
Mongolia	2001	510
Mongolia	2002	586

country	1999	2000	2001	2002
Angola	800	750	925	1020
India	20100	25650	26800	27255
Mongolia	450	512	510	586

Pivot data wider

```
data %>%  
  pivot_wider(  
    names_from = "year",  
    values_from = "cases"  
  )
```

& [Mara Averick](#)

Joins

★ left_join()
★ inner_join()
★ full_join()

left_join(x, y)

1	x1	1	y1
2	x2	2	y2
3	x3	4	y4
		2	y5

inner_join(x, y)

1	x1	1	y1
2	x2	2	y2
3	x3	4	y4

full_join(x, y)

1	x1	1	y1
2	x2	2	y2
3	x3	4	y4

For a fun explanation using The Beatles & Rolling Stones see Nic Crane's tweet:

<https://bit.ly/3qfhBb9>

Credit: Garrick Aden-Buie

<https://www.garrickadenbuie.com/project/tidyexplain/>

Dates

★ `separate()` turns a character column into multiple columns

Order of elements in date-time	Parse function
year, month, day	★ <code>ymd()</code>
year, day, month	<code>ydm()</code>
month, day, year	<code>mdy()</code>
day, month, year	<code>dmy()</code>
hour, minute	<code>hm()</code>
hour, minute, second	<code>hms()</code>
year, month, day, hour, minute, second	<code>ymd_hms()</code>

*adapted from *Dates and Times Made Easy with lubridate* (Grolemund & Wickham, 2011)

```
#where col = name of column to separate
# into = vector of names for column to be separated into
# sep = value to separate column at
separate(data, col, into, sep)

#example we have seen before
separate(financial_year, into = c("year", NA), sep = "/")
```

Factors & Strings

★ `levels()` to see the set of levels in the factor

★ `fct_relevel()` to manually reorder factor levels

★ `fct_recode()` to manually change the levels labels

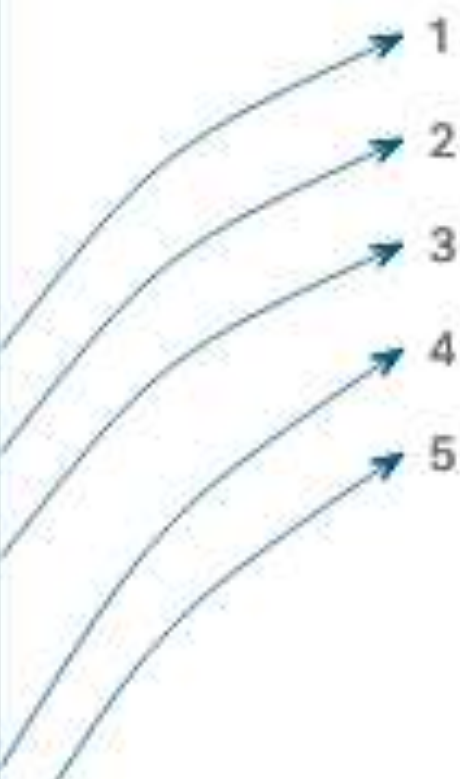

★ `fct_collapse()` to collapse levels into manually defined groups

★ `str_replace()` to change the labels of a string

★ `str_wrap()` to wrap the text of a string if it is too long into 2+ lines

Example: Visualisation of the `filter()` function

```
filter(bill_length_mm > 45)
```

	species	bill_length_mm
1	Adelie	41.80
2	Adelie	36.50
3	Adelie	40.30
4	Chinstrap	45.40
5	Chinstrap	46.50
6	Chinstrap	46
7	Gentoo	43.60
8	Gentoo	45.10
9	Gentoo	50.70

	species	bill_length_mm
1	Chinstrap	45.40
2	Chinstrap	46.50
3	Chinstrap	46
4	Gentoo	45.10
5	Gentoo	50.70

Data

- ★ `+ theme_bw()`
`+ theme_classic()` etc.
- ★ `+ coord_flip()`
 - Example: `+ stat_summary()`
- ★ `+ facet_wrap()`
`+ facet_grid(x~y)`
- ★ `+ geom_line()` + `geom_bar()`
`+ geom_jitter()` etc.
- ★ `ggplot(data, aes(x, y, color, shape, fill))`
- ★ `ggplot(data)`

Numerical	Numerical	 <ul style="list-style-type: none"> Scatter plot (point) 2D binning (bin2d, hex) Contour plot (density2d) Quantiles (quantile, qq) Lines (line, smooth) Ribbons (ribbon, area) 	Categorical	 <ul style="list-style-type: none"> Boxplot (boxplot, violin) Counts (count, tile) Error bars (errorbar) Columns (col)
	Categorical	<p><i>Which ggplot2 data viz is right for your data?</i> (geoms in parentheses)</p>		 <ul style="list-style-type: none"> Mosaic (ggmosaic::geom_mosaic) Counts (count, tile)

From Dr Sam Tyner's guest lecture recording in Week 4

Importance of variable class

ggplot2 Cheatsheet

Data Visualization with ggplot2 :: CHEAT SHEET

Basics

ggplot2 is based on the **grammar of graphics**, the idea that you can build every graph from the same components: a **data** set, a **coordinate system**, and **geoms**—visual marks that represent data points.

To display values, map variables in the data to visual properties of the geom (**aesthetics**) like **size**, **color**, and **x** and **y** locations.

Complete the template below to build a graph.

```
ggplot(data = <DATA>) +  
  <GEOM_FUNCTION>(mapping = aes(<MAPPINGS>),  
    stat = <STAT>, position = <POSITION>) +  
  <COORDINATE_FUNCTION> +  
  <FACET_FUNCTION> +  
  <SCALE_FUNCTION> +  
  <THEME_FUNCTION>
```

required
Not required, sensible defaults supplied

ggplot(data = mpg, aes(x = cty, y = hwy)) Begins a plot that you finish by adding layers to. Add one geom function per layer.

last_plot() Returns the last plot.

ggsave("plot.png", width = 5, height = 5) Saves last plot as 5' x 5' file named "plot.png" in working directory. Matches file type to file extension.

Aes

Common aesthetic values.

color and **fill** - string ("red", "#RRGGBB")

linetype - integer or string (0 = "blank", 1 = "solid", 2 = "dashed", 3 = "dotted", 4 = "dotdash", 5 = "longdash", 6 = "twodash")

lineend - string ("round", "butt", or "square")

linejoin - string ("round", "mitre", or "bevel")

size - integer (line width in mm)

shape - integer/shape name or a single character ("a")

Geoms

Use a geom function to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer.

GRAPHICAL PRIMITIVES

a <- ggplot(economics, aes(date, unemploy))
b <- ggplot(seals, aes(x = long, y = lat))

a + geom_blank() and **a + expand_limits()**
Ensure limits include values across all plots.

b + geom_curve(aes(yend = lat + 1, xend = long + 1, curvature = 1) - x, yend, y, yend, alpha, angle, color, curvature, linetype, size)

a + geom_path(lineend = "butt", linejoin = "round", linemitre = 1) - x, y, alpha, color, group, linetype, size

a + geom_polygon(aes(alpha = 50)) - x, y, alpha, color, fill, group, subgroup, linetype, size

b + geom_rect(aes(xmin = long, ymin = lat, xmax = long + 1, ymax = lat + 1)) - xmax, xmin, ymax, ymin, alpha, color, fill, linetype, size

a + geom_ribbon(aes(ymin = unemploy - 900, ymax = unemploy + 900)) - x, ymax, ymin, alpha, color, fill, group, linetype, size

LINE SEGMENTS

common aesthetics: x, y, alpha, color, linetype, size

b + geom_abline(aes(intercept = 0, slope = 1))
b + geom_hline(aes(yintercept = lat))
b + geom_vline(aes(xintercept = long))

b + geom_segment(aes(yend = lat + 1, xend = long + 1))
b + geom_spoke(aes(angle = 1:1155, radius = 1))

ONE VARIABLE continuous

c <- ggplot(mpg, aes(hwy)); c2 <- ggplot(mpg)

c + geom_area(stat = "bin")
x, y, alpha, color, fill, linetype, size

c + geom_density(kernel = "gaussian")
x, y, alpha, color, fill, group, linetype, size, weight

c + geom_dotplot()
x, y, alpha, color, fill

c + geom_freqpoly()
x, y, alpha, color, group, linetype, size

c + geom_histogram(binwidth = 5)
x, y, alpha, color, fill, linetype, size, weight

c2 + geom_qq(aes(sample = hwy))
x, y, alpha, color, fill, linetype, size, weight

discrete

d <- ggplot(mpg, aes(fill))

d + geom_bar()
x, alpha, color, fill, linetype, size, weight

TWO VARIABLES

both continuous

e <- ggplot(mpg, aes(cty, hwy))

e + geom_label(aes(label = cty), nudge_x = 1, nudge_y = 1) - x, y, label, alpha, angle, color, family, fontface, hjust, lineheight, size, vjust

e + geom_point()
x, y, alpha, color, fill, shape, size, stroke

e + geom_quantile()
x, y, alpha, color, group, linetype, size, weight

e + geom_rug(sides = "b")
x, y, alpha, color, linetype, size

e + geom_smooth(method = lm)
x, y, alpha, color, fill, group, linetype, size, weight

e + geom_text(aes(label = cty), nudge_x = 1, nudge_y = 1) - x, y, label, alpha, angle, color, family, fontface, hjust, lineheight, size, vjust

one discrete, one continuous

f <- ggplot(mpg, aes(class, hwy))

f + geom_col()
x, y, alpha, color, fill, group, linetype, size

f + geom_boxplot()
x, y, lower, middle, upper, ymax, ymin, alpha, color, fill, group, linetype, shape, size, weight

f + geom_dotplot(binaxis = "y", stackdir = "center")
x, y, alpha, color, fill, group

f + geom_violin(scale = "area")
x, y, alpha, color, fill, group, linetype, size, weight

both discrete

g <- ggplot(diamonds, aes(cut, color))

g + geom_count()
x, y, alpha, color, fill, shape, size, stroke

e + geom_jitter(height = 2, width = 2)
x, y, alpha, color, fill, shape, size

THREE VARIABLES

seals\$z <- with(seals, sqrt(delta_long^2 + delta_lat^2)); l <- ggplot(seals, aes(long, lat))

l + geom_contour(aes(z = z))
x, y, z, alpha, color, group, linetype, size, weight

l + geom_contour_filled(aes(fill = z))
x, y, alpha, color, fill, group, linetype, size, subgroup

continuous bivariate distribution

h <- ggplot(diamonds, aes(carat, price))

h + geom_bin2d(binwidth = c(0.25, 500))
x, y, alpha, color, fill, linetype, size, weight

h + geom_density_2d()
x, y, alpha, color, group, linetype, size

h + geom_hex()
x, y, alpha, color, fill, size

continuous function

i <- ggplot(economics, aes(date, unemploy))

i + geom_area()
x, y, alpha, color, fill, linetype, size

i + geom_line()
x, y, alpha, color, group, linetype, size

i + geom_step(direction = "hv")
x, y, alpha, color, group, linetype, size

visualizing error

df <- data.frame(grp = c("A", "B"), fit = 4:5, se = 1:2)
j <- ggplot(df, aes(grp, fit, ymin = fit - se, ymax = fit + se))

j + geom_crossbar(fatten = 2) - x, y, ymax, ymin, alpha, color, fill, group, linetype, size

j + geom_errorbar() - x, ymax, ymin, alpha, color, group, linetype, size, width
Also **geom_errorbarh**()

j + geom_linerange()
x, ymin, ymax, alpha, color, group, linetype, size

j + geom_pointrange() - x, y, ymin, ymax, alpha, color, fill, group, linetype, shape, size

maps

data <- data.frame(murder = USArrests\$Murder, state = tolower(rownames(USArrests)))

map <- map_data("state")

k <- ggplot(data, aes(fill = murder))

k + geom_map(aes(map_id = state), map = map) + **expand_limits**(x = map\$long, y = map\$lat)
map_id, alpha, color, fill, linetype, size

Color palettes

Emil Hvitfeldt has created a “one stop destination for anyone looking for a color palette to use in r.”

<https://github.com/EmilHvitfeldt/r-color-palettes>

Including an interactive color selector!

<https://emilhvitfeldt.github.io/r-color-palettes/discrete.html>

Text

Text

Code –
setup chunk

Code

Code

```
1 ---
2 title: "Title"
3 author: "Author"
4 date: "Date"
5 output: html_document
6 ---
7 |
8 {r setup, include=FALSE}
9 knitr::opts_chunk$set(echo = TRUE)
10
11
12 ## R Markdown
13
14 This is an R Markdown document. Markdown is a simple formatting syntax for
15 authoring HTML, PDF, and MS Word documents. For more details on using R Markdown
16 see <http://rmarkdown.rstudio.com>.
17
18 When you click the **Knit** button a document will be generated that includes
19 both content as well as the output of any embedded R code chunks within the
20 document. You can embed an R code chunk like this:
21
22 {r cars}
23 summary(cars)
24
25
26 ## Including Plots
27
28 You can also embed plots, for example:
29
30 {r pressure, echo=FALSE}
31 plot(pressure)
32
33
34 Note that the `echo = FALSE` parameter was added to the code chunk to prevent
35 printing of the R code that generated the plot.
```
